

WORKSHOP 2020 2-6 NOVEMBER 2020

LECTURE 4: EVN CALIBRATION BASICS

Benito Marcote (JIVE) @jive.marcote

...You will get the *concepts* for the steps you run in CASA for EVN data

- Paralactic angle correction
- ☑ A-priori gain calibration
- ☑ Bandpass calibration
- ☑ Fringe-fitting
- ☑ Cleaning
- ☑ [Self-calibration]

This is not a talk about fundamentals of radio interferometers but...

A couple of slides to refresh all's minds!

Radio Astronomy Third Edition

Interferometry and Synthesis in Radio Astronomy

Martin Charles and

A-priori model:

- \mathbf{v} Station and source position.
- 🗹 Times.

I ...

- Earth orientation (precession, notation, polar motion)
- 🗹 Diurnal spin
- ☑ Tides (solid-Earth, pole)

A-priori model:

- \mathbf{v} Station and source position.
- 🗹 Times.

I ...

- Earth orientation (precession, notation, polar motion)
- 🗹 Diurnal spin
- ☑ Tides (solid-Earth, pole)

Visibilities

 \mathbf{V} Complex numbers: $V_{i,j}(u, v)$

Solution Baseline vector:
$$\mathbf{b}_{i,j} = \lambda(u, v, w) = \mathbf{r}_i - \mathbf{r}_j$$

Sky intensity:
$$I_v(l,m)$$

 $V_{i,j}(u,v) = \int I_v(l,m) e^{-2\pi i (ul+vm)} dl dm$

Correlator

Connected interferometers – Very Long Baseline Interferometry

- Different atmosphere conditions at each telescope (troposphere & ionosphere)

- Earth tectonic motions
- Instrumental effects

It's all about phases...

Source/Station/Earth orientation

Propagation

Instrumental effects

Source structure

Phases may evolve faster with time for long baselines:

Phases: φ Delays: дφ дω Rates: $\partial \varphi$ ∂t

(fringe-fitting)

See next lecture!

If Bright (high S/N) and compact sources are mandatory for calibration purposes.

Propagation effects are direction dependent.

☑ Target: faint or resolved? —> requires a nearby phase-calibrator source.

Absolute astrometry? -> requires a nearby calibrator source.

M Phase calibrator: strong and compact source within a few degrees.

I Fringe-finders (bandpass calibrators): strong sources, can be farther away.

Polarization calibration? —> unpolarized calibrator or with known pol.

VLBI typical observation

Two calibration steps already performed during the internal processing of EVN data. But in CASA you need to apply the calibration:

Paralactic angle & mount type Keep parang=True

☑ A-priori gain calibration

append_tsys.py gc.py gencal()

VLBI VLBI gain calibration

In connected interferometers:

- Observe an amplitude (or gain) calibrator: point-like source with no variability
 - -> amplitudes known.

🧭 In VLBI:

- Most of the sources are resolved to some extend.
- The compact ones are typically highly variable.

VLBI VLBI gain calibration

System temperature:

"Power" measured by the station only from the system noise.

- System Equivalent Flux Density (SEFD).
 Flux density of a fictitious source delivering the same power as the system noise.
- ✓ Gain (or sensitivity): Increase in T for a source of 1 Jy.
 - **Markov Absolute gain:** DPFU (degrees per flux unit)
 - Gain curve: dependency with zenith angle (elevation, etc...).

Always ~10% uncertainty!

CASA
(Reminder] Fourier transforms

A Pelta function is transformed into a constant. * If offset from x = 0, then into a sinusoidal function.

A Gaussian function is transformed into another Gaussian function.

A 20 Delta function is transformed into a plane (any U, V point sees the same value).

A 20 Gaussian function is transformed into a 20 Gaussian.

A point-like source will appear with the sample amplitude at all baselines (u,v points).

 A resolved source will show a lower amplitude at longer baselines (even down to zero).

A 2D Delta function is transformed into a plane (any U, V point sees the same value).

Constant amplitudes.

Zero phases.

 $\mathbf{\underline{M}}$ Along the time.

Mong the frequency.

PHASES

AMPLITUDE

FREQUENCY

TIME

- Constant amplitudes.
- Zero phases.
- $\mathbf{\underline{M}}$ Along the time.
- Along the frequency.

- Zero phases.
- $\mathbf{\underline{M}}$ Along the time.
- Along the frequency.

- Constant amplitudes.
- Zero phases.
- $\mathbf{\underline{M}}$ Along the time.
- Along the frequency.

VLBI VLBI Calibration

Instrumental delay correction:

- Picking up just a single scan (e.g. fringe finder).
- \mathbf{V} Phase slope that will be corrected.
- Phase jumps between (some) subbands.
 Different hardware -> instrumental delays
- These jumps should be consistent along the observation.

```
fringefit(vis='experiment.ms',
    caltable='cal.sbd'
    field='fringe-finder-name',
    timerange='a-couple-of-minutes',
    solint='inf',
    zerorates=True,
    refant='EF',
    minsnr=10,
    gaintable=['cal.tsys', 'cal.gcal', ...],
    parang=True)
```

VLBI VLBI Calibration

Instrumental delay correction:

- Picking up just a single scan (e.g. fringe finder).
- \mathbf{V} Phase slope that will be corrected.
- Phase jumps between (some) subbands.
 Different hardware -> instrumental delays
- These jumps should be consistent along the observation.

```
fringefit(vis='experiment.ms',
    caltable='cal.sbd'
    field='fringe-finder-name',
    timerange='a-couple-of-minutes',
    solint='inf',
    zerorates=True,
    refant='EF',
    minsnr=10,
    gaintable=['cal.tsys', 'cal.gcal', ...],
    parang=True)
```

VLBI VLBI calibration

Bandpass calibration:

- Correct for the effect of the band in the different subbands.
- ☑ Instrumental effect. Constant in time/source.
- **I** Use the brightest source for that (highest S/N)
 - -> fringe finder(s).

```
bandpass(vis='experiment.ms',
    caltable='cal.bpass'
    field='fringe-finder-name',
    gaintable=['cal.tsys', 'cal.gcal', ...],
    solnorm=True,
    solint='inf',
    refant='EF',
    bandtype='B',
    parang=True)
```

VLBI VLBI calibration

Bandpass calibration:

- Correct for the effect of the band in the different subbands.
- ☑ Instrumental effect. Constant in time/source.
- **I** Use the brightest source for that (highest S/N)
 - -> fringe finder(s).

```
bandpass(vis='experiment.ms',
    caltable='cal.bpass'
    field='fringe-finder-name',
    gaintable=['cal.tsys', 'cal.gcal', ...],
    solnorm=True,
    solint='inf',
    refant='EF',
    bandtype='B',
    parang=True)
```

- ✓ The main amplitude calibration is then done between the initial *a-priori* gain corrections with the system temperatures and the bandpass.
- Small deviations, also depending on the source elevation, etc. could still be present.
- Self-calibration (Lecture 9, Wednesday) would solve them.

TIME

Global fringe

(or frequency- and time-dependent phase calibration)

- **I** Fit the evolution of delays and rates for **each** calibrator source along the observation.
- **Mathebra Corrections depend on the propagation effects** (atmosphere).

```
fringefit(vis='experiment.ms',
    caltable='cal.mbd',
    solint='t min',
   combine='spw',
   field='calsource1, calsource2,...',
   refant='EF',
   minsnr=7,
   gaintable=['cal.tsys', 'cal.gcal', 'cal.bpass',
'cal.sbd', ...],
    parang=True)
```

Global fringe

(or frequency- and time-dependent phase calibration)

- ☑ Fit the evolution of delays and rates for each calibrator source along the observation.
- Corrections depend on the propagation effects (atmosphere).

```
fringefit(vis='experiment.ms',
    caltable='cal.mbd',
    solint='t min',
    combine='spw',
    field='calsource1, calsource2,...',
    refant='EF',
    minsnr=7,
    gaintable=['cal.tsys', 'cal.gcal', 'cal.bpass',
    'cal.sbd', ...],
    parang=True)
```

Transfer the solutions to the target source (applycal).

M Imaging

Self-calibrationAnd iterate!

VLBI images Some important remarks

The more sparse *uv* coverage implies:

🗹 Non-gaussian noise.

Strongest spikes in the imaged field: $6-\sigma$ level required.

- Measured flux densities may (slightly) differ when doing in the image plane or *uv* plane.
- Images with source structures may be sensitive to calibration. Check your calibration!

Always with extreme caution!

You "modify" your data to *fit* your model.

- Can easily scale up/down your station amplitudes (artificially).
- **Markov Lecture 9** on Wednesday 9:30UT (Javier Moldón)

EVN Data Reduction Guide: <u>https://www.evlbi.org/evn-data-reduction-guide</u>

But doing a convenient scheduling is the first step for a good calibration:
