

JUC, 13-11-2-15, 11.00, Arpad's room

present Harro, Jon, Des, Arpad

Des: one element of todo list checked: write JSON next to output. Worked on CALC on unictl, make one button for operators. However, not sure this should not be calculated on cc-beta? Why unictl. Promoting the run script into "real" function. Both ongoing, done next week (?)

Next, interface with eBob code.

Jon: problems with connection between unictl and Astron svn. Ongoing. Worked on UB2, I2C interfaces. Eric came back from Oz, explained some code. HEM review soon.

Arpad: what about testing all inputs/outputs.

Harro: will make fake VEX and JSON, however maybe not before NZ. Des will enable all outputs, which is needed. After all this in place, actually do tests.

Jon and Des will re-start 32MHz testing, work around unictl problems
