JUC meeting, 6-2-2014, Arpad's room

present: Salvatore, Jonathan, Des, Harro, Arpad

- Jonathan: validities are now looking healthy. Data from 8 stations good (one input node), 11 stations fails, problem with synchronization. In some integration that are blips in phase, maybe in all stations, seen in all cross corr. Recovers afterwards, it seems. Will do short simulation. Still some timing errors, also after signal taps removed from design. Salvatore thinks there is a not too difficult fix, but wait if there is a simpler solution first.

Suleyman finally did send a design, without FFT, webex about this tomorrow. Seems more work than anticipated?

- Des: erlang control talks to erlang on Mk5s and commands get through all the way to jive5ab. Control system of sorts will be up soonish, but cannot talk to eBobs stuff yet. Next step.

- Harro proposes additional topic for mRnDm next week, namely the enormous amount of polling going on in control system. Controlmk5 could/should also be replaced.
