

JUC, 21-4-2017, 15.00

present Des, Benito, Jonathan, Arpad, Harro via telephone

Des: just tried an (simulated) e-test, failed as mark5 reservation system failed. eBob to fix it. Most changes should be done, Now have to retry disk-based correlation to see if that is not broken in the process.

Jonathan: fixed the problem with start on odd or even sample. The phases in the 64 and 32 personalities now show the same trend, but noisier. Will do more simulations. Weights were strange, this morning only zeros out of UB. Restart, all fine again. Need to keep an eye on this.

Des: latest cpp sender has no slow-down. Harro: indeed, was just a hack.
Des: new version of control code should solve this with round robin.

Benito: still trying image with structure. Checking ms. Weights at 15? Same data set, only different scans, more of them, and spectral averaging done in UB, not afterwards. Will check this, might have to do with funny state of UB? On Monday.
