JUC meeting, 25/6/2014, Arpad's room

present Harro, Jonathan, Des, Guifre, Arpad

Des: IT does not work. Data sender, corner turner, all work(ed) individually, on Aribox at least, now not. At least, understandable error messages. Ongoing.

Jonathan: looked at bug that causes everything to stop, once a week or so. It looks like the synchronization fifo does not get the signal that integration has finished. App-reset clears it, good state, but still no frames. Counter is in, but found mistake in the code. More signal taps! Ongoing.
Exchange of fifo with registers: Sergei thinks it should be tested, but does not think it can make a big difference. Asked Jonathan to build in a switch to turn off fract. delay in runtime and flip phase. Not done yet. Ongoing

Harro: how about comparing SFXC and UB plots, nobody knows how to make them but Sergei, he seems not to think it is important... ask again.

Guifre: did not try to match time stamps, will do so now
