

JUC, 25-5-2018, 11.00

present Des, Harro, Benito, Jonathan, Arpad

Des: done an e-test, wrong date in vex file, in the end used non-cornerturned vex file, fix on the fly, not really as it should be. Frame sizes were confused. Should all be fixed now. Also cleaned some old dependencies on jive5ab. Still some outstanding issues for disk-based correlation.

Benito: has to send bug report to Des. Will not have time to work on this for next 2 weeks, then try again a correlation.

Des: half weights are not in e, exactly what was expected. But, 16 MHz in 32 MHz personality?

Jonathan: will look into this this afternoon

Some discussion about use as geo correlator, logistics needed for sub-netting, use of cal tones. First get JUC to work reliably with many stations. Next e, try to get everybody to switch to new Fila firmware, run in test time.

Harro: lots of info in logfiles, should make this visible in some way. List needed of what people want to be able to show.
