

JUC, 28-09-2018

present Benito, Jonathan, Harro, Des, Arpad

Jon: wrong weights were caused by 18 bit accumulator overflow. Try to increase to 32, need extra memory here and there, should be ok. Only timing needs checking. Today.

Des: did test during e, only 1 fringe, did not get time to fix things. Paul said it should be possible to get 3 telescopes for 1 day, Wb does not do anything anyway, On has two, Jb. Harro will set that up.

Harro: no action yet, TOG + EVN, afterwards.

Arpad: could test anyway before next e, sneak in an hour of tests before the science. Might simply work

Benito: will get going after session.

Some discussion about playback speed, should punch a hole in the gui to make it possible to set IPD. Des will ask eBob
