WURM, 7/1/2019, 14.00

present Aard, Paul, eBob, Harro, Arpad

Aard: working on what he calls profiling tools (displaying profile tools rather), which did not work properly on new E3. There were two versions, now making one, which immediately shows the building up of the pulsar profile. Also re-merge the de-dispersion code, this time without debug info, and in chunks.

Paul: blow fiber on Saturday, maybe. Investigate flexbuff 12. Move IP address of casadev. Make a number of VMs. Find out what happens with power supply of flexbuff 7 (Wb), one is broken. Not heard yet whether Wb maser is still in lock.

eBob: got a mail from Hanno just before Xmas about the proposal tool, a webservice which translates source name to coordinates will cease to exist (Simbad?). There is alternative code, but for that need to re-build our code, found there is no access to one of the SVN reps. Also, the server on which we used to build it has gone. Sent email to Hanno. Working on making pySCHED an Anaconda package. Took a look at Noto data, which had some very short scans. Flexbuff gets too small packets, stops recording. Competing traffic? Only happened once, not possible to find out what it was.

Harro: many small things of last year. Matplotlib on E3. Anaconda update? e-recording performance, Paul will upgrade flexbuff 5, eBob will run test. Finally, monitoring, waiting for Zabbix VM
