

WURM, 9/1/2017, 14.00

present Wybren, Ilse, Paul, Mark, Jonathan, Aard, eBob, Harro

Wybren: trying to figure out ownership of last files from Aribox. Send an email to Petrov. Throw away the rest. Will try to get Aribox up and running today. Investigate NFS problem further

Ilse: wrapping up document for EHT. Look at Lofar data, see if reduction in Casa works

Paul: email with China, received SFPs which were supposed to be compatible with HP, but switch does not recognise them as such. On the other hand, they work, so not worth making too much fuss. IPMI port still flapping, annoying. Continuing with ccs, number of programs ported. Disks received for Italian flexbuffs

Mark: upgraded tail, however, reboots most of the time. Maybe not touch head before vacation. Fall-back should still be ok. Will send out first version of Cleo document before vacation

Jonathan: built filter not to reply to every packet. Simulated, compiling. Only in 16MHz version for now. Can toggle on/off, which could be done every second or so.

Aard: got Casa to build. Now trying to get it to work with new python.

eBob: bughunt last week, had been fixed but NFS crash of 2015 restored the unfixed version. Continue work on runjob eVLBI recording.

Harro: will try to get on with file transfer utility. However, several bug reports on new version of jive5ab, like new disk pack that could not be erased, Yb reporting that one reply does not have the same format as it used to have, which causes the FS to be unhappy. Vlbish however kind of finished, available for testing, seems quite an improvement.
