WURM, 14-11-2016, 14.30, Arpad's room

present Wybren, Paul, eBob, Des, Ilse, Mark, Harro, Arpad

Wybren: after e, will finish replacing keys. Looking into use of UB keys. Fixed the lack of backups, will fix LDAP and libgsl

Paul: migration of cluster servers done, nodes back to SFXC. Hospital next

eBob: tested eVLBI recording up to 2Gbps, no problems, Wybren changed buffers, helped. Harro should check numbers with Wybren, at flexbuff at stations tuning was also done. This week, look at Bonn project archival inclusion

Des: trying to compare SFXC with JUC. Unfortunately, one personality 16, one 64, none 32, so results were rather weird. Ask Jonathan. Continuing fringe fitter work, will do small test with minpack (LS solver to be included in casa core)

Ilse: Aips and NMEs, comparing CASA and Aips. Need standard expt, this one a bit tricky with sub-arrays. Looking into Tsys and antab tables. CASA tutorial soon, will ask around in Astron as well.

Mark: removing bugs from Antab parser, improving error messages. Deller found bug in Obit, so new release made, regenerating list with Parseltongue users. Bert complains about use of SFXC by Benito. Mark will talk to Benito, make sure he communicates tests with Bert, maybe let him run it.

Harro: SFXC-JUC comparison, spent some time teaching Benito the plotting tools. Non-bank mode of Mkar5 is being tested, may still be FW bugs, but spend minimum time possible on this. Jay now at Apex, Harro will help him with recording. Experimenting with C++11 for new Cleopatra tool
