

WURM, 26-06-2017, 14.00

present Wybren, Mark, Paul, Des, eBob, Aard, Harro, Arpad

Wybren: investigating openflow. Marcopolo recovery ongoing, maybe will work. Aribox broken disk. Continue comparison of monitoring programs

Mark: readying CASA mods for checking in. Doing various tests. George not available this week

Paul: Columbus also died, will set up backup for these machines, buy disks for Trantor and SSD. TTEC still cannot give any quotes, as parent firm is going bankrupt. Tomorrow will talk with a firm called dimension about networking equipment.

Des: UniBoard refuses to accept simulated data. Handed over to Jonathan. Testing C++ fringe fitting prototype. Need to check first version in

eBob: made version of runjob with subnetting. Will now work on changes requested for UniBoard. Another disk with 0 bytes, from T6 this time. Need to restore, logs seem fine. Harro: Bonn complained about Wb disk with same problem. New people, maybe forgot to erase? eBob also works on documentation of f2py, need to locate key-in reader in SCHED

Aard: RA still no luck. Running automated search, unfortunately no good fringe finder. Dima will pass by soonish, can take a look. If not, will give up officially. High time to come up with a new stable version of SFXC

Harro: good progress with file transfer, TCP/UDT with both IPV4 and 6.

Discussion about E3, what to do? Consensus is that we should buy new machine, fast disks, make working version and then start replacing bits of pipeline. Arpad: talk to dr Bob about money.
