GUIDE FOR FTP TESTS DURING NMES

Version 1.0

Before the NME start

Make vaxfile

In case Bob has not made it yet:

Log in to **ccsbeta**:

```
ssh -X jops@ccsbeta
cd /ccs/expr/
mkdir <EXP> # if necessary
cd <EXP>
```

If the .vax does not exist, the create it:

```
log2vex.pl
```

Then follow the next steps:

- · Select Experiment.
- EOP (Earth orientation parameters).
- TapeLog: prefer e-vlbi (for NMEs).
- · Sched: from Skdfile.
- · Clock.
- Show Clock graph: do all stations have a clock value? Is the fit OK?
- Compile Vexfile (press BITSTREAMS)
- Print/Save: default name.

And you need to rename the file:

```
mv <exp>.vexfile <exp>.vax
```

Check vaxfile

You should check at the end of the .vax file the clock section. If some values are missed you should ask the station friend about it during the Skype session and update the clocks.

Step-by-step guide for the SFXC

Log in to **head.sfxc** (where the SFXC resides). There is a copy in **tail.sfxc** in case head is not available.

```
ssh -X jops@head.sfxc
cd ~/sfxc/ftp/<session_name>/ # e.g. 2017_may
mkdir <exp>
cd <exp>
scp -p jops@ccsbeta:/ccs/expr/EXP/<exp>.vax .
```

Now you can run ftptest.py to create the necessary folder structure for the NME:

```
ftptest.py -h
usage: ftptest.py [-h] [-a ANT] [-e SETANT] [-r REFANT] [-c
CHANNELS] [-f FFT] [-s SCANS] [-d] [-g] vex
Generate shit for an ftp fringe test.
positional arguments:
                    vex-file name
optional arguments:
 -h, --help show this help message and exit
 -a ANT, --ant ANT
                     antenna 2-letter codes
 -e SETANT, --setant SETANT
                      Reference setup antenna 2-letter code
 -r REFANT, --refant REFANT
                      Reference antenna 2-letter code
  -c CHANNELS, --channels CHANNELS
                      channels to use, counting from 1
 -f FFT, --fft FFT number of fft points to use
```

```
-s SCANS, --scans SCANS

ftp-scans to generate stuff for

-d, --dummy make a dummy list of file locations

-g, --gabri create folders according to Gabriele's taste
```

If you run it as

```
ftptest.py -d -g <exp>.vax
```

it creates all the directories and dummy files for all the ftp-tests that are present in the vaxfile. If you don't use the -d option the script looks for real data on sfxc-h1.

Remember to modify the .scan##.ctrl file according to the data available for SFXC. Or run ftptest.py without the -d option again just before running SFXC.

In case you decide to prepare everything manually: In ~/sfxc/ftp/<session_name>//:

```
mkdir ctrl
mkdir html
mkdir output
```

and inside each directory create a directory for each scan that will be part of the FTP-tests (check the .vax file). Copy the .vax file into ctrl/scan##/ and copy a ctrl file from a previous NME and edit it according to the FTP-test.

Preparing the website for the NME

Go to **dop288** to prepare the *ftp.html* file by adding the new NME.

```
ssh -X jops@dop288
cd /www/evlbi.org/tog/ftp_fringes/
vim ftp.html # or your favourite editor
```

Add the path for the experiment, save it, and close it.

```
mkdir <EXP>
cd <EXP>
cp ../<EXP_OLD>/index.html .
vim index.html  # Modify it accordingly to the NME, save it
mkdir scan##  # Create a directory for each scan
```

Otherwise you can also run ftptest_report.py to make a draft of index.html.

Monitor the arriving data

All participating stations send data to JIVE.

```
ssh fringetest.jive.nl
cd /ftp/ftpdata/
ls -ltr *<exp>*00##* # where ## is the number of the scan
```

check here the right name of the data files and which has arrived. You can also use some features of *ftptest.py* right before running SFXC to include only the files that have arrived.

Start chat session

Open Slack and create a new channel for this NME. Announce it in the general channel.

In case it is necessary: open Skype and start a group chat. Add here all the people from the involved stations. Below there is a list of people (Skype names) for each station:

- **Ef**: Effelsberg Friend (*effelsberg_vlbi*) Uwe Bach (*uwe_interwegs*)
- **Wb**: Geert Kuper (*geertkuper*) Antonis Polatidis (*apolatid*) Richard Blaauw (*blaauw.richard*)
- **Jb**: Jodrell Bank VLBI Room (*jodrell_vlbi*) Alastair Gunn (*alastair.gunn*)

- On: Jun Yang (uaoagn) Michael Lindqvist (ml_nolvik) Observer OSO (observer_oso) Roger Hammargren (roger.hammargren)
- Mc: Giuseppe Maccaferri (gmacc06) Andrea Orlati (goldenarm1474)
- Nt: Noto Friend (noto.friend) Salvo Buttaccio (salvo.b-vlbi)
- Tr: Torun Telescope Operator (torun_telescope_operator) Sebastian Soberski (torun-ssober) Kaz Borkowski (tr-kaz) Grzegorz Hrynek (vario_vlbi)
- **Sh/T6**: VLBI-SH (*vlbi_sh*)
- KVAZARs: Andrey M. (agm.iaa)
- **Hh**: HartRAO Friend (*vlbi_hh*) Jonathan Quick (*jfhquick*)
- Ys: Pablo de Vicente (pablo.d.vicente) Yebes40m (yebes40m)
- Ur: (uaonanshan)
- Sr: Carlo Migoni (carlo.migoni) Control Room SRT (srtcontrolroom)
- Ar: Tapasi Ghosh (tghosh9)
- **Km**: (kunming40)
- Ir: Vladislavs Bezrukovs (slavabezrukov) Miks (mikskapers)
- Mh: Kurpro (kurpro)
- KVN: AOC KVN (kvn.aoc)

Correlation with SFXC

Once the NME starts and you have data from the stations you can run SFXC in head.sfxc:

```
cd ~/sfxc/ftp/<session_name>/<exp>/ctrl/scan##
run_sfxc.py <exp>.vax <exp>/scan##.ctrl
```

It generates all the html that are in

```
~/sfxc/ftp/<session_name>/<exp>/html/scan##/
```

You can look at the *index.html* file by running Firefox. If everything looks OK you can copy all the files to **dop288**:

```
scp -r
jops@head.sfxc:/home/jops/sfxc/ftp/<session_name>/<exp>/html/scan##
/\* /www/evlbi.org/tog/ftp_fringes/<EXP>/
```

After the NME

You should send an email to EVNtech@jb.man.ac.uk (with copy to Bob, jops@jive.eu) with the subject: EVNtech: N17C1 FTP Fringe Test Results.

In the body of the email you have to write something like:

```
Version: 1
Summary:
Ftp data arrived from:
Ef, Wb, Jb, On, Mc, Nt, Tr, Ys, Sh, T6, Td, Yd, Md, Sd.
Selected results can be found here:
http://www.evlbi.org/tog/ftp_fringes/N14M1
Legend:
Y = Performed as expected
N = Did not perform as expected
? = No feedback available from station
Blank = Not applicable or waiting for further tests
F14M1, Freq= 6662.52-6674.52 MHz; Mode=1024 ch-128 Mbps-16x2MHz-
2sec; obs
date=01/03/2014
        |Ef|Jb|Wb|On|Mc|Nt|Tr|Ys|Sh|T6|Td|Yd|Md
                                             |Sd|
|Y |
|Y |
Record. OK |Y||Y||Y||Y||Y||Y||Y||Y||Y||Y|
                                             |Y |
| Y |
Check VCs | | | | | |7,8| | | | | |1,2,3,4,5| |
|e |
Notes:
general: the calibrator used in scan02 (3C48) is much weaker than
calibrator
used in scan21 and scan59 (DA193). This is the reason of the lack
of fringes
```

```
for scan02.

a) Tr: no fringes in BBCs 7 and 8.

b) Tr also sent DBBC data designated as 'Td'.

c) Ys also sent DBBC data designated as 'Yd'.

d) Mc also sent DBBC data designated as 'Md'. Md shows weaker fringes than Mc, this could be the reason of no fringes in DBBCs 1 (LL-USB & LSB), 2 (RR-LSB), 3(LL-USB & LSB), 4(RR-LSB), 5 (LL-LSB)

e) T6 also sent DBBC data designated as 'Sd'.

questions/comments - please email surcis@jive.nl

Regards,
```

Automatic Fringe Test

In ccsbeta in the directory where .vax is you should type:

```
ssh -Y jops@ccsbeta
cd /ccs/expr/{expname}

# If needed:
log2vex.pl
    - tapelog evlbi
    - EOP
    - Sched from Skdfile
    - Clock
    - Compile vexfile

vex2db <exp>.vax
```

```
example: schedule_fringe_test -e N16M1 -n No0002 -s EfJb08 -m
surcis@jive.eu
```

You can specify either the scan number or the time from when you want the data in vex format (e.g. 2017y290d12h42m00s).

```
The data are in ssh -X -l jops sfxc.h0.sfxc in /scratch/sfxc/fringetest/NAMEEXP/
```

if you wish to recorrelate, type in ccsbeta

In case of questions contact eBob (eldering@jive.eu)
